

The Part has been arrayed into a four by six grid, on top of this grid are four larger versions of the part, and above it all lies a single large version.

The structure may be modified by altering the grid, or by altering one of two parameters.

Parameter one is known as "leaf width". The parameter varies the width of the vertical "leaves" in an inverse proportion to the horizontal "leaves".

Parameter two is known as "height divisor". The parameter sets the overall volume of the interior, and inversely sets the height of each individual part. As the interior becomes taller, the parts become more flat.
